NetAgro's history

NetAgro

Farmers can visualize agricultural indices and calculate land area for precision agriculture.

NDVI and **Water Stress (NDWI)** available to analyze vegetation and soil humidity. In the future, it will be possible to add new indices.

What is a vegetation index?

It is a mathematical combination or transformation of spectral bands that accentuates the spectral properties of green plants so that they appear distinct from other image features.

African vegetation based on NDVI (NASA Earth Observatory)

What is NDVI?

“Normalized Difference Vegetation Index”.

It is a vegetation index that indicates the level of crop reflectivity and is frequently used as an agricultural indicator to estimate:

- Biomass (vegetation)
- Crop status

Features of NDVI

- Ranges between -1 and 1.
- Densely vegetated areas give high values close to 0.9.
- Water gives values close to 0 or -0.
- Dry soils with little vegetation give values close to 0.1.

How to calculate NDVI

- Searching and obtaining satellite images.
- Calibrating and correcting satellite images.
- Eliminating clouds.
- Calculating NDVI.
- Coloring satellite images through a user-friendly color palette.
- Cutting out insured lots from colored images.

EXTRA FUNCTIONALITY

Agricultural producers may also enter **georeferenced notes** with multimedia content and visualize them in the map.

Other tools include **weather information** and a **seeding density calculator**.

NetAgro

Platforms and Services

BENEFITS

- Available free of charge for agricultural insurance.
- Multiple tools in only one app.
- Automation in the underwriting process.
- New communication channel between company and insured.
- Possibility of adding services and tools for our customers.

THANKS!
